Handout 14: The rubric

One sheet per student pair. The teacher uses it twice: when the class picks one student pair's version of a function as the clearest (any day), and for each student pair's Day 10 presentation. Circle one box per row; the rows are the four things the course asks for, and the levels say what each one looks like.

	Getting there	Solid	Strong
Correctness	The function runs, but some of its tests fail	Every test passes	Every test passes, and the student pair found and fixed a case the tests missed
Evidence	The student pair says it works	The student pair points to the passing tests, the matching perft count, or the benchmark numbers	The student pair shows the numbers and says what a wrong number would have looked like
Explanation	The student pair reads the code aloud	The student pair explains what each line does in its own words	The student pair explains why the code is written that way, and what would go wrong if a line were removed
Teamwork	One partner did the work	The driver and the navigator swapped each period, and both can run the code	Both partners can explain every line, and each can say what the other caught

Function picked or presentation: _____ Date: _____

Notes:
