Handout 2: Undo cards

Undo from the card. Day 2, period 4. Team name: _____

The three undo cards are printed below, side by side; nothing is cut out. The navigator plays three moves on the board and fills in one card for each move, as it is made. The driver looks away. Then the driver takes this sheet, and only this sheet, and puts the board back to the start position, newest card first.

A card holds exactly what `make_move()` will return on this period: the move, the piece that moved, the piece it captured (write `.` for none), and the three parts of the state that the move overwrites.

Undo card 1	**Undo card 2**	**Undo card 3**
Move (from square to to square)	Move (from square to to square)	Move (from square to to square)
Piece that moved	Piece that moved	Piece that moved
Piece captured (`.` for none)	Piece captured (`.` for none)	Piece captured (`.` for none)
Old en passant square (or none)	Old en passant square (or none)	Old en passant square (or none)
Old halfmove clock	Old halfmove clock	Old halfmove clock
Old fullmove number	Old fullmove number	Old fullmove number

Did the board come back exactly? Yes / No. If not, which card was missing something?

_____

What would go wrong if a card had no "piece captured" line?

_____
